

2010 Apple Rootstock Trials

November, 2011 -- Grand Rapids, MI

Wesley R. Autio

Data Collection & Transmission

This year was the second season of the 2010 NC-140 Apple Rootstock Trials. Data submitted in 2011, however, were for the first growing season (2010). All submitted data were received in an easily read format, but there appears to be a few problems with units. Everyone is encouraged to review their data and make sure that all measurements are the unit requested. Union height from 2010 may have been submitted in inches from some locations. Another problem with the 2010 data submission was the lack of submission by 45% of the planting locations. This situation is completely unacceptable. All data should be submitted in the format and units requested and by the submission deadline (January 15).

The 2010 data also pointed out an additional concern. In this trial, we have multiple trees of the same rootstocks in each replication. Since we need to keep the data together for each individual tree throughout the trial, we need to add an addition-

To avoid problems during the compilation of the data, please pay particular attention to the following points:

1. Submit only the data requested.
2. Use the correct units.
3. Make sure that all data make sense -- proofread your data set.
4. For rootstock and replication designations, follow the protocol exactly -- rootstock names should appear as they are listed in the Data Submission Protocol (Page 2) -- please note that there are no spaces in any of these names.

Rootstocks, cultivars, and locations involved in the 2010 NC-140 Apple Rootstock Trial. Honeycrisp plantings are spaced 4'x12', and Fuji plantings are spaced 6'x14'. All trees are trained to the Tall Spindle System.

| Rootstocks | Honeycrisp sites | Aztec Fuji sites |

Highlighted locations did not submit 2010 data!

Send 2010 data via email to Wes Autio (autio@pssci.umass.edu) by

January 15, 2012

Trial Protocol for 2012

Tree management.

- A. Trees must be supported and trained as Tall Spindles (see Pruning & Training Plan, 3rd Leaf).
- B. Adjust crop load as described in the Pruning & Training Plan, 3rd Leaf.
- C. For Honeycrisp, apply naphthalene acetic acid (NAA) as described in the Pruning & Training Plan, 3rd Leaf.
- D. Manage pests, nutrients, and water per local recommendations. Pay attention to weed control in this trial.

Collect the follow data for each tree in 2012.

- A. Root suckers: the number removed and counted, August.
- B. Yield: count all fruit per tree and weigh (to the nearest 0.1 kg).
- C. Zonal leaf chlorosis: after Honeycrisp harvest, visually estimate the portion (%) of the canopy exhibiting symptoms.
- D. Trunk size: trunk circumference 30 cm above the graft union (mm), October.
- E. Status: 0=dead, 1=alive, and 2=missing data, October.

Data Submission Protocol

Submit data via email (autio@pssci.umass.edu) by **January 15, 2012**.

STATE 2010 Apple Rootstock Trial DATA FOR 2011

| Cultivar | Rootstock | Rep | Rep | 2010 | | | | | Side branches (see below) | Height of the graft union (spring, 2010, mm) | Trunk circ. (spring, 2010, mm) | no.>10cm | Comments regarding trees which died during 2010 (those with status = 0) | 2011 | | | | Comments regarding trees which died during 2011 (those with status = 0) |
|------------|-----------|-----|-----|------------------|--------------------|--------------------|---|-------------------|---------------------------|--|--------------------------------|----------|---|---|------------------|---|--|---|
| | | | | Status | Trunk circ. | Branches | Comments regarding 1=alive, 2=missing clusters (0=dead, data) | Root sucker (no.) | | | | | | Yield per tree (Aug, 2011, fruited) (no.) | Trunk circ. (mm) | | | |
| | | | | 2010 (see below) | (spring, 2010, mm) | (spring, 2010, mm) | (no.) | (no.) | | | | | | (kg) | mm) | | | |
| Honeycrisp | B.9 | 1 | 1 | 1 | X | X | X | 1 | X | X | X | X | X | | | | | |

| . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | | |
| . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | . | | |
| Honeycrisp | M.26EMLA | 4 | 1 | 1 | X | X | X | 0 | X | X | X | X | X | Voles | | | | |
| Honeycrisp | M.26EMLA | 4 | 2 | 3 | . | . | . | 2 | . | . | . | . | . | | . | . | | |
| Honeycrisp | M.26EMLA | 4 | 3 | 4 | . | . | . | 2 | . | . | . | . | . | | . | . | | |

Special requirements for 2010's status assessment:

0 = died after it was clearly growing well

1 = alive

2 = considered to be a non-data tree because of human error (like tractor blight)

3 = planted but broke at the union before it was fully supported

4 = leafed out but quickly shut down

5 = never leafed out and began to grow

When a data point is missing, insert a period in that cell, but do not replace zeros with periods.

REQUIRED DATA FORMAT: Excel or Quattro Pro

Appropriate Rootstock Codes: (do not include spaces in the rootstock name)

al designation per tree. Another column has been added to the data submission protocol (Page 2) requesting a sub-replication number. Simply number each tree of the same rootstock within a replication in sequence from 1 to 3, and maintain that number consistently through the trial. Additionally, all data from the beginning of the trial will be requested each year (see Page 2). Delinquent cooperators need not submit 2010 data, but must include these data in the 2011 submission.

Data submitted for 2011 should include cultivar, rootstock, replication, sub-replication, 2010 status, spring 2010 trunk circumference (mm), spring 2010 side branches (no. > 10cm), spring 2010 graft union

height (mm), fall 2010 trunk circumference (mm), comments on 2010 tree death, 2011 status, 2011 root suckers (no.), fall 2011 trunk circumference (mm), and comments on 2011 tree death. The format of the data submission is presented in the Data Submission Protocol on Page 2. Submit these data in spreadsheet format (Excel preferred), using the rootstock codes described in the protocol, by **January 15, 2012**.

In 2012, follow the Pruning and Training Plan (Page 3) and the Trial Protocol for 2012 (Page 2). In August, count and cut root suckers, and measure trunk circumference (mm) 30 cm above the graft union in October. Measure yield by counting and weighing all fruit from each tree.

| <i>Pruning and Training Plan for the Tall Spindle System</i> | | |
|---|-------------|---|
| <i>1st Leaf</i> | At Planting | Adjust graft union to 6" (15 cm) above the soil level. Remove all feathers below 24" (60 cm) using a flush cut. Do not head the leader or feathers. Remove any feathers that are larger than 2/3 the diameter of the leader leaving a stub. |
| | 3-4" Growth | Rub off 2 nd and 3 rd buds below the new leader bud to eliminate competitors to the leader shoot. |
| | May | Install a 3- or 4-wire tree support system that will allow tree to be supported to 3 m. Attach trees to support system with a permanent tree tie above the 1 st tier of scaffolds, leaving a 2-inch diameter loop to allow for trunk growth. |
| | Early June | Tie down each feather that is longer than 10" (25 cm) to a pendant position below horizontal. |
| <i>2nd Leaf</i> | Dormant | Do not head the leader or prune the tree. |
| | 3-4" Growth | Rub off 2 nd and 3 rd buds below the new leader bud to eliminate competitors to the leader shoot. |
| | Early June | Defruit trees in this trial. |
| | Mid June | Tie the developing leader to the support system with a permanent tie. |
| <i>3rd Leaf</i> | Dormant | Do not head the leader. Using a bevel cut, remove any overly vigorous limbs that are more than $\frac{2}{3}$ the diameter of the leader. |
| | Late May | Hand thin within 3-4 weeks after petal fall to appropriate levels of crop load (Honeycrisp – 4 fruit/cm², Fuji -- 5 fruit/cm²) to ensure regular annual cropping and adequate fruit size. Calculate a crop-load target for each tree based on the previous fall's trunk cross-sectional area. |
| | June | Tie the developing leader to the support system with a permanent tie. |
| | June-July | For Honeycrisp, apply four 5-ppm naphthalene acetic acid applications at 1-week to 10-day intervals beginning when fruit reach an average of 30 mm in diameter. |
| <i>4th Leaf</i> | Dormant | Do not head the leader. Using a bevel cut, remove any overly vigorous limbs that are more than $\frac{2}{3}$ the diameter of the leader. |
| | Late May | Chemically thin, and then follow up with hand thinning to appropriate levels to ensure regular annual cropping and adequate fruit size. (Target = 100 fruits/tree) |
| | June | Tie the developing leader to the support system with a permanent tie. |
| <i>Mature Tree</i> | Dormant | <ol style="list-style-type: none"> 1. Limit tree height to 11.5' (3.6m) by annually cutting leader back to a weak fruitful side branch. 2. Annually, remove at least 2 limbs, including lower tier scaffolds, that are more than $\frac{3}{4}$" in diameter using a bevel cut. 3. Simplify each remaining branch on the tree so that it is columnar with no major side branches. 4. Shorten branches that extend into the row to facilitate movement of equipment and preserve fruit quality on the lower limbs. |
| | Late May | Chemically thin, and then follow up with hand thinning to appropriate levels to ensure regular annual cropping and adequate fruit size. (Target = 120-150 fruits/tree) |
| | August | Lightly summer prune to encourage light penetration and maintain pyramidal tree shape. |
