

# 2010 Apple Rootstock Trials

November, 2013 -- Meridian, ID

Wesley R. Autio

This year was the fourth season of the 2010 NC-140 Apple Rootstock Trials. Data submitted in 2012-13, however, were for the third growing season (2012). All submitted data were received in an easily read format, but there were a few problems with cooperators following the protocol. **Everyone is encouraged to review their data and make sure that all measurements are the unit requested. Further, include only those data requested in the protocol, with the same columns in the spreadsheet, and in the same order.** A problem with the 2012 (and 2010 and 2011) data submission was the lack of submission by some cooperators -- this situation is completely unacceptable. All data should be submitted in the format and units requested and by the submission deadline (January 15).

The data to be submitted and the format of the data submission are presented in the Data Submission Protocol on Page 3. Submit these data in spreadsheet format (Excel preferred), using the rootstock codes described in the protocol, by **January 15, 2014**.

In 2014, follow the Pruning and Training Plan (Page 2) and the Trial Protocol for 2014 (Page 2).

Rootstocks, cultivars, and locations involved in the 2010 NC-140 Apple Rootstock Trial. Honeycrisp plantings are spaced 4'x12', and Fuji plantings are spaced 6'x14'. All trees are trained to the Tall Spindle System.

\*No data were submitted for 2012.

*To avoid problems during the compilation of the data, please pay particular attention to the following points:*

1. Submit **only the data requested**.
2. Use the **correct units**.
3. **Columns must be consistent with the protocol**.
3. **Make sure that all data make sense -- proofread your data set.**
4. **For rootstock and replication designations, follow the protocol exactly -- rootstock names should appear as they are listed in the Data Submission Protocol (Page 3) -- please note that there are no spaces in any of these names.**

Send 2010 data via email to Wes Autio (autio@umass.edu) by

**January 15, 2014**

# Trial Protocol for 2014

***Tree management.***

- A. Trees must be supported and trained as Tall Spindles (see Pruning & Training Plan, Mature Tree).
- B. Adjust crop load as described in the Pruning & Training Plan, Mature Tree.
- C. Manage pests, nutrients, and water per local recommendations. Pay attention to weed control in this trial.

***Collect the follow data for each tree in 2014 (note that a 5-year report will be written).***

- A. Root suckers: the number removed and counted, August.
- B. Yield: count all fruit per tree and weigh (to the nearest 0.1 kg).
- C. Zonal leaf chlorosis: after Honeycrisp harvest, visually estimate the portion (%) of the canopy exhibiting symptoms.
- D. Trunk size: trunk circumference 30 cm above the graft union (mm), October.
- E. Canopy height: height from the soil surface to the top of the leader (cm), October.
- F. Canopy spread: average of in-row and across-row canopy width (cm), October.
- G. Status: 0=dead, 1=alive, and 2=missing data, October.

## ***Pruning and Training Plan for the Tall Spindle System***

<b><i>Mature Tree</i></b>	Dormant	<ol style="list-style-type: none"> <li>1. Limit tree height to 11.5' (3.6m) by annually cutting leader back to a weak fruitful side branch.</li> <li>2. Annually, remove at least 2 limbs, including lower tier scaffolds, that are more than 3/4" in diameter using a bevel cut.</li> <li>3. Simplify each remaining branch on the tree so that it is columnar with no major side branches.</li> <li>4. Shorten branches that extend into the row to facilitate movement of equipment and preserve fruit quality on the lower limbs.</li> </ol>
	Late May	Chemically thin, and then follow up with hand thinning to appropriate levels to ensure regular annual cropping and adequate fruit size. (Target = 120-150 fruits/tree)
	August	Lightly summer prune to encourage light penetration and maintain pyramidal tree shape.

Table 1. Trunk cross-sectional area, root suckers, yield, yield efficiency, and fruit size of Honeycrisp apple trees in the 2010 NC-140 Honeycrisp Apple Rootstock Trial. Numbers representing average fruit size are least-squares means adjusted for crop load.

Rootstock	Trunk cross-sectional area (2012, cm <sup>2</sup> )	Cumulative root suckers (2010-12, no.)	Zonal chlorosis (% of leaf)	Yield per tree (2012, kg)	Yield efficiency (2012, kg/cm <sup>2</sup> )	Average fruit size (g)
